

Complex task

Task 1. Jmeter task

Make 16 requests so that first 3 of them reach one host and each 4-th request is sent to another host using logic controllers (e.g. 3 - google.com; 1 - yahoo.com; 3 - google.com; 1 - yahoo.com and so on).

Learn about types of HTTP requests.

Reference: http://jmeter.apache.org/usermanual/component_reference.html.

Task 2. SQL task

Write the list of SQL requests in a separate file to create:

- a database;
- three tables within this database;
- fill these tables;
- simple statements: Select from one table, Select from few tables, Count rows for any table.

Task 3.

Create an account on <http://github.com/>. Create New Repository.

Useful info: <https://help.github.com/articles/create-a-repo>

Push results for 2 tasks above to your repository.

As a result of all these tasks please provide URL to your repository.
